1 Numerical results

Sections 5.1 and 5.2 of the main paper present the tables with the ranks obtained by MOEAs using the same algorithmic framework (i.e., MOEAs using the NSGA-III, RVEA, and MOEA/D frameworks) in terms of HV and SPD on MOPs with regular and irregular PF shapes, respectively. Additionally, such tables show if adaptive versions of NSGA-III, RVEA, and MOEA/D perform significantly better, significantly worse, or statistically equivalent to their original versions based on a one-tailed Wilcoxon test using a significance level of $\alpha = 0.05$. Thus, in this supplementary material, we include the tables that contain the mean and standard deviations of MOEAs among 30 independent runs in each MOP.

1.1 Regular PF shapes

First, Tables 1 and 2 present the results of MOEAs using the NSGA-III framework on MOPs with regular PF shapes in terms of HV and SPD, respectively. Then, the performance comparison of MOEAs using the RVEA framework on MOPs with regular PF shapes based on HV and SPD is shown in Tables 3 and 4, respectively. Finally, Tables 5 and 6 contain the results of MOEAs using the MOEA/D framework on MOPs with regular PF shapes in terms of HV and SPD, respectively. Among the obtained results, it can be seen that all versions of NSGA-III-Ada \mathcal{K} , RVEA-Ada \mathcal{K} , and MOEA/D-Ada \mathcal{K} can maintain or improve the performance of NSGA-III, RVEA, and MOEA/D, respectively, on most MOPs in terms of HV and SPD. In contrast, A-NSGA-III and RVEA* degrade the performance of their original versions on most MOPs in terms of HV and SPD. Also, AdaW degrades the performance of MOEA/D on most MOPs in terms of HV, while it maintains or improves the performance of MOEA/D on slightly more than half of the MOPs in terms of SPD. However, all versions of MOEA/D-Ada \mathcal{K} maintain or improve the performance of MOEA/D on more MOPs than AdaW based on HV and SPD. Thus, results show that our proposed adaptation method avoids degrading the performance of MOEAs that use predefined WVRSSs on most MOPs with regular PF shapes regardless of their algorithmic framework.

1.2 Irregular PF shapes

First, the performance comparison of MOEAs using the NSGA-III framework on MOPs with irregular PF shapes based on HV and SPD can be observed in Tables 7 and 8, respectively. Then, Tables 9 and 10 show the results of MOEAs using the framework of RVEA on MOPs with irregular PF shapes in terms of HV and SPD, respectively. Finally, the results of MOEAs using the MOEA/D framework on MOPs with irregular PF shapes in terms of HV and SPD are shown in Tables 11 and 12, respectively. The obtained results indicate that all MOEAs with our adaptation method improve the performance of their original versions on most MOPs in terms of HV and SDP. Also, RVEA* and AdaW can enhance the performance of RVEA and MOEA/D on most MOPs in terms of HV and SPD. However, A-NSGA-III cannot improve the performance of NSGA-III on most MOPs based on HV and SPD. Additionally, it can be seen that RVEA-AdaCOU, RVEA-AdaPT, and RVEA-AdaKRA enhance the performance of RVEA on more MOPs than RVEA* in terms of HV, while all versions of RVEA-Ada \mathcal{K} improve the performance of RVEA on more MOPs than

Table 1: Mean and standard deviations (in parenthesis) of the HV indicator obtained by MOEAs using the NSGA-III framework on MOPs with regular PF shapes. The two best mean values per MOP are highlighted in grayscale, where the darker tone corresponds to the best one. The symbols “+”, “-”, and “=” are placed when the MOEA performs significantly better, significantly worse, or statistically equivalent to NSGA-III based on a one-tailed Wilcoxon test using a significance level of $\alpha = 0.05$. The % of satisfaction refers to the percentage of MOPs where the MOEA performs significantly better or statistically equivalent to NSGA-III. The superscripts are the obtained rank in the comparison.

Table 2: Mean and standard deviations (in parenthesis) of the SPD indicator obtained by MOEAs using the NSGA-III framework on MOPs with regular PF shapes. The two best mean values per MOP are highlighted in grayscale, where the darker tone corresponds to the best one. The symbols “+”, “-”, and “=” are placed when the MOEA performs significantly better, significantly worse, or statistically equivalent to NSGA-III based on a one-tailed Wilcoxon test using a significance level of $\alpha = 0.05$. The % of satisfaction refers to the percentage of MOPs where the MOEA performs significantly better or statistically equivalent to NSGA-III. The superscripts are the obtained rank in the comparison.

Table 3: Mean and standard deviations (in parenthesis) of the HV indicator obtained by MOEAs using the RVEA framework on MOPs with regular PF shapes. The two best mean values per MOP are highlighted in grayscale, where the darker tone corresponds to the best one. The symbols “+”, “-”, and “=” are placed when the MOEA performs significantly better, significantly worse, or statistically equivalent to RVEA based on a one-tailed Wilcoxon test using a significance level of $\alpha = 0.05$. The % of satisfaction refers to the percentage of MOPs where the MOEA performs significantly better or statistically equivalent to RVEA. The superscripts are the obtained rank in the comparison.

Table 4: Mean and standard deviations (in parenthesis) of the SPD indicator obtained by MOEAs using the RVEA framework on MOPs with regular PF shapes. The two best mean values per MOP are highlighted in grayscale, where the darker tone corresponds to the best one. The symbols “+”, “-”, and “=” are placed when the MOEA performs significantly better, significantly worse, or statistically equivalent to RVEA based on a one-tailed Wilcoxon test using a significance level of $\alpha = 0.05$. The % of satisfaction refers to the percentage of MOPs where the MOEA performs significantly better or statistically equivalent to RVEA. The superscripts are the obtained rank in the comparison.

Table 5: Mean and standard deviations (in parenthesis) of the HV indicator obtained by MOEAs using the MOEA/D framework on MOPs with regular PF shapes. The two best mean values per MOP are highlighted in grayscale, where the darker tone corresponds to the best one. The symbols “+”, “-”, and “=” are placed when the MOEA performs significantly better, significantly worse, or statistically equivalent to MOEA/D based on a one-tailed Wilcoxon test using a significance level of $\alpha = 0.05$. The % of satisfaction refers to the percentage of MOPs where the MOEA performs significantly better or statistically equivalent to MOEA/D. The superscripts are the obtained rank in the comparison.

Table 6: Mean and standard deviations (in parenthesis) of the SPD indicator obtained by MOEAs using the MOEA/D framework on MOPs with regular PF shapes. The two best mean values per MOP are highlighted in grayscale, where the darker tone corresponds to the best one. The symbols “+”, “-”, and “=” are placed when the MOEA performs significantly better, significantly worse, or statistically equivalent to MOEA/D based on a one-tailed Wilcoxon test using a significance level of $\alpha = 0.05$. The % of satisfaction refers to the percentage of MOPs where the MOEA performs significantly better or statistically equivalent to MOEA/D. The superscripts are the obtained rank in the comparison.

Table 8: Mean and standard deviations (in parenthesis) of the SPD indicator obtained by MOEAs using the NSGA-III framework on MOPs with irregular PF shapes. The two best mean values per MOP are highlighted in grayscale, where the darker tone corresponds to the best one. The symbols “+”, “-”, and “=” are placed when the MOEA performs significantly better, significantly worse, or statistically equivalent to NSGA-III based on a one-tailed Wilcoxon test using a significance level of $\alpha = 0.05$. The % of satisfaction refers to the percentage of MOPs where the MOEA performs significantly better than NSGA-III. The superscripts are the obtained rank in the comparison.

Table 9: Mean and standard deviations (in parenthesis) of the HV indicator obtained by MOEAs using the RVEA framework on MOPs with irregular PF shapes. The two best mean values per MOP are highlighted in grayscale, where the darker tone corresponds to the best one. The symbols “+”, “-”, and “=” are placed when the MOEA performs significantly better, significantly worse, or statistically equivalent to RVEA based on a one-tailed Wilcoxon test using a significance level of $\alpha = 0.05$. The % of satisfaction refers to the percentage of MOPs where the MOEA performs significantly better than RVEA. The superscripts are the obtained rank in the comparison.

Table 10: Mean and standard deviations (in parenthesis) of the SPD indicator obtained by MOEAs using the RVEA framework on MOPs with irregular PF shapes. The two best mean values per MOP are highlighted in grayscale, where the darker tone corresponds to the best one. The symbols “+”, “-”, and “=” are placed when the MOEA performs significantly better, significantly worse, or statistically equivalent to RVEA based on a one-tailed Wilcoxon test using a significance level of $\alpha = 0.05$. The % of satisfaction refers to the percentage of MOPs where the MOEA performs significantly better than RVEA. The superscripts are the obtained rank in the comparison.

Table 11: Mean and standard deviations (in parenthesis) of the HV indicator obtained by MOEAs using the MOEA/D framework on MOPs with irregular PF shapes. The two best mean values per MOP are highlighted in grayscale, where the darker tone corresponds to the best one. The symbols “+”, “-”, and “=” are placed when the MOEA performs significantly better, significantly worse, or statistically equivalent to MOEA/D based on a one-tailed Wilcoxon test using a significance level of $\alpha = 0.05$. The % of satisfaction refers to the percentage of MOPs where the MOEA performs significantly better than MOEA/D. The superscripts are the obtained rank in the comparison.

Table 12: Mean and standard deviations (in parenthesis) of the SPD indicator obtained by MOEAs using the MOEA/D framework on MOPs with irregular PF shapes. The two best mean values per MOP are highlighted in grayscale, where the darker tone corresponds to the best one. The symbols “+”, “-”, and “=” are placed when the MOEA performs significantly better, significantly worse, or statistically equivalent to MOEA/D based on a one-tailed Wilcoxon test using a significance level of $\alpha = 0.05$. The % of satisfaction refers to the percentage of MOPs where the MOEA performs significantly better than MOEA/D. The superscripts are the obtained rank in the comparison.

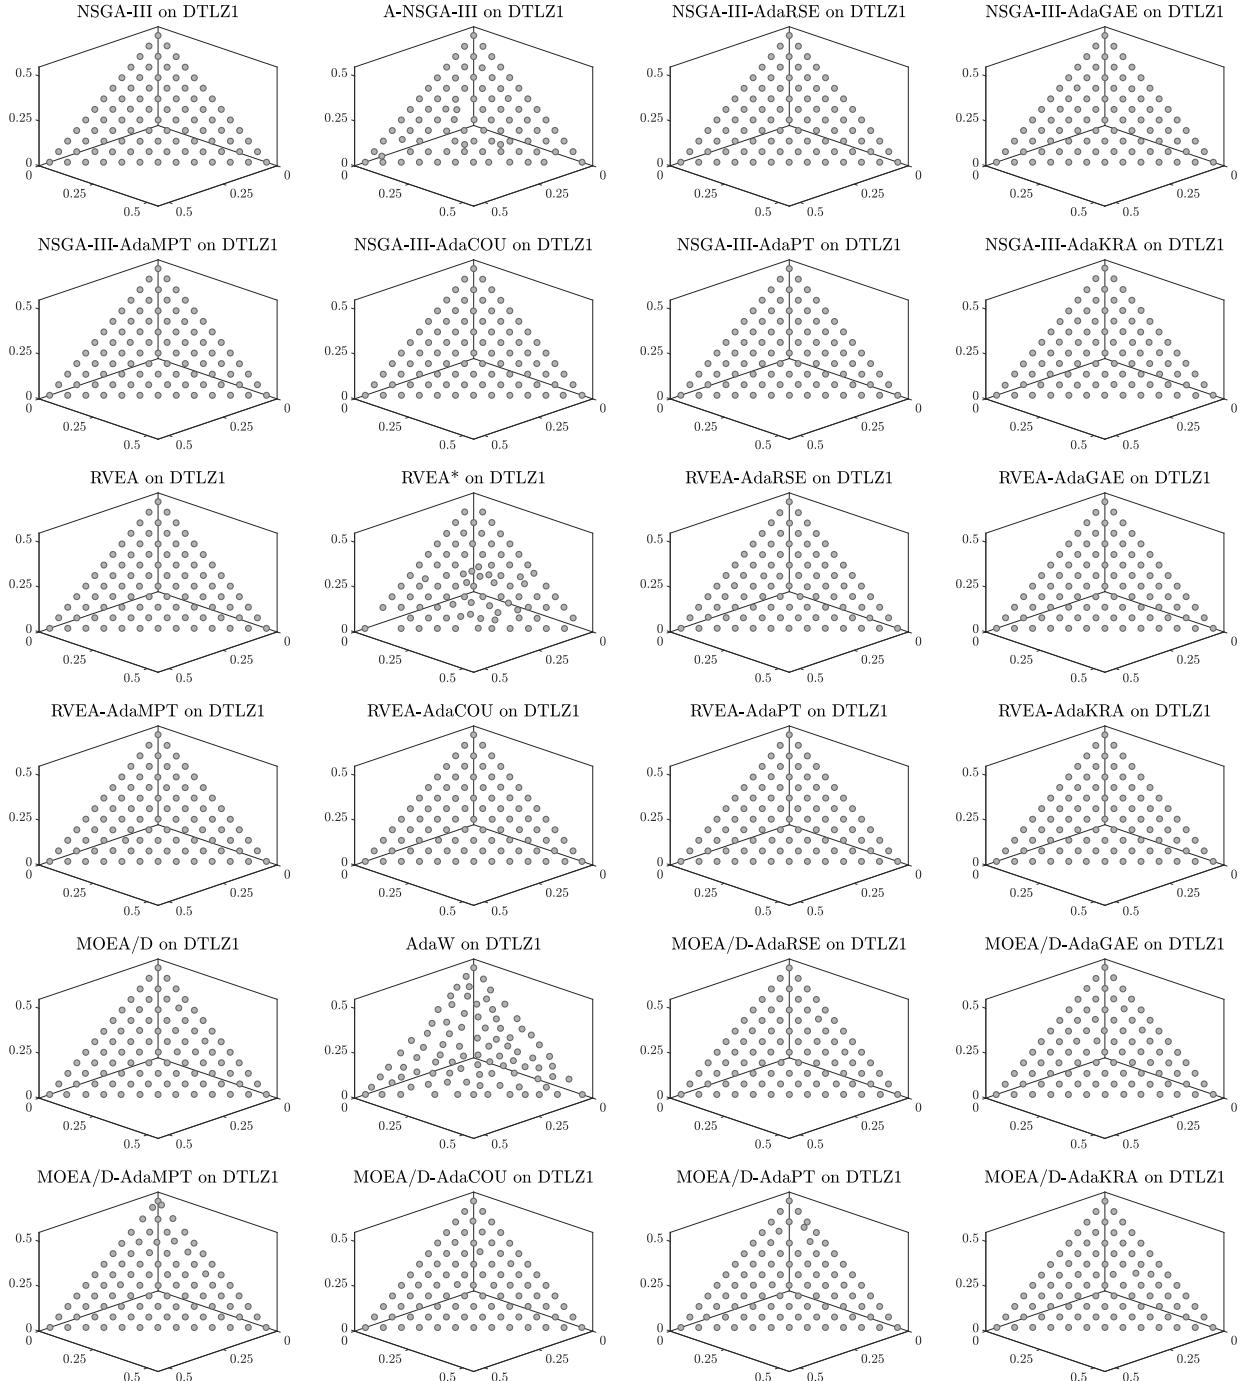

Figure 1: Final populations with the median HV value among 30 independent runs of MOEAs using the NSGA-III, RVEA, and MOEA/D frameworks on DTLZ1 with 3 objective functions.

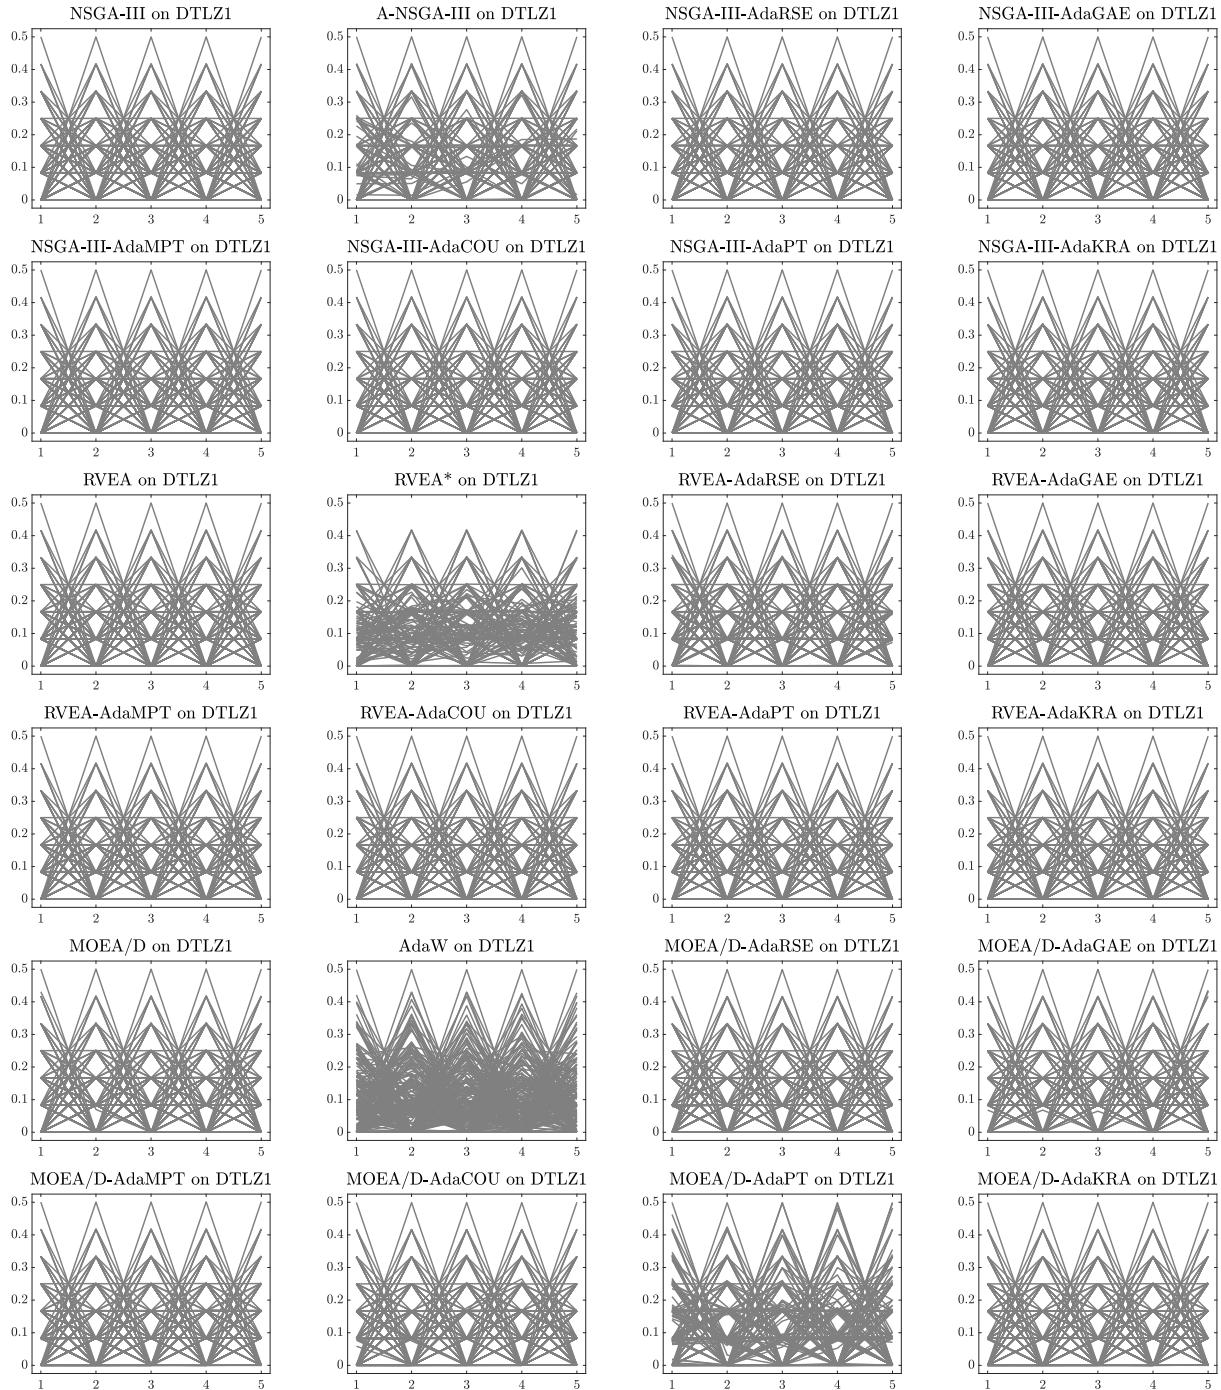

Figure 2: Final populations with the median HV value among 30 independent runs of MOEAs using the NSGA-III, RVEA, and MOEA/D frameworks on DTLZ1 with 5 objective functions.

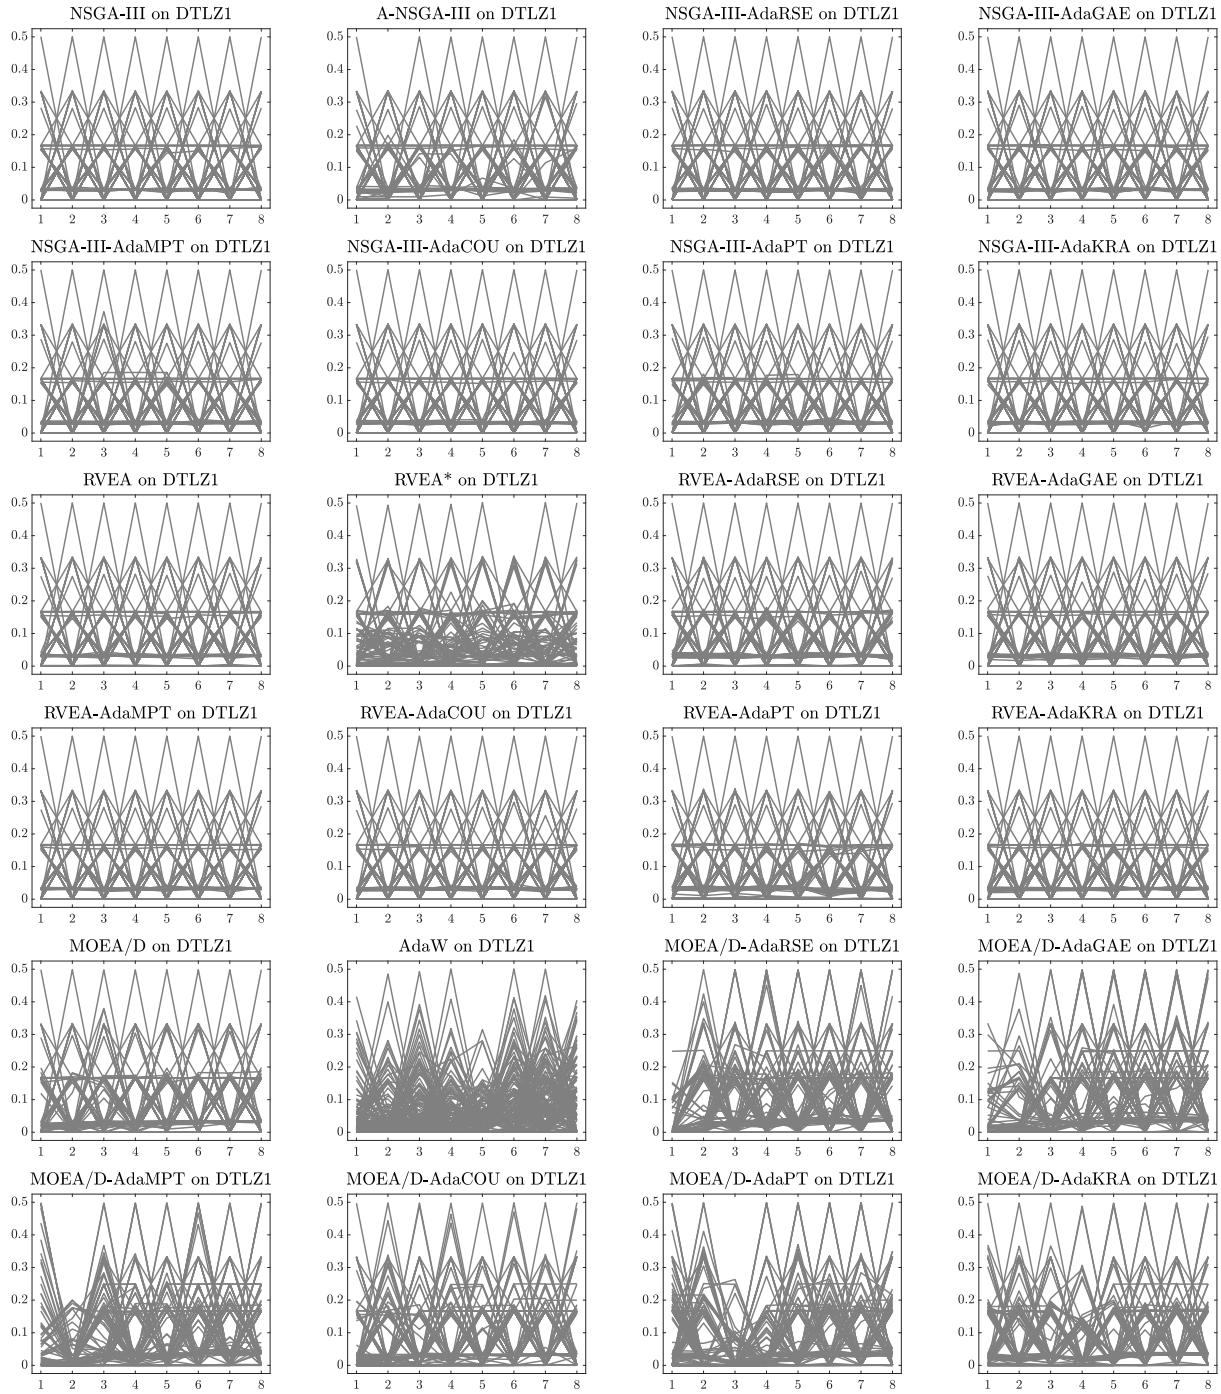

Figure 3: Final populations with the median HV value among 30 independent runs of MOEAs using the NSGA-III, RVEA, and MOEA/D frameworks on DTLZ1 with 8 objective functions.

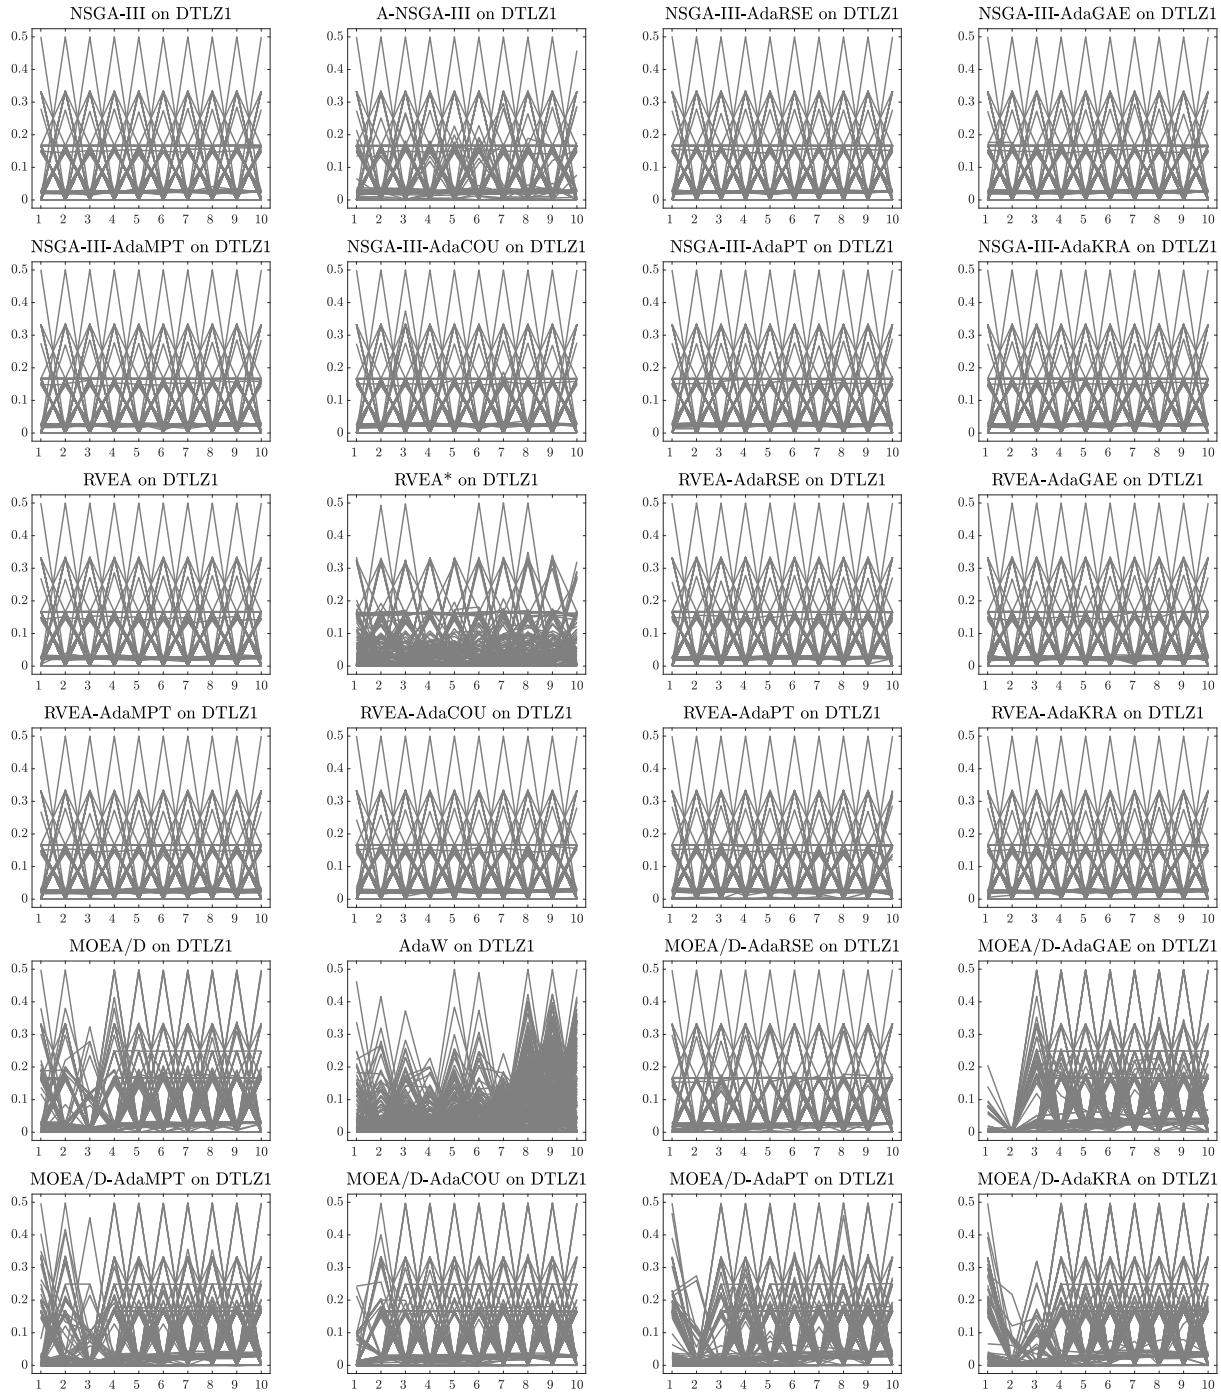

Figure 4: Final populations with the median HV value among 30 independent runs of MOEAs using the NSGA-III, RVEA, and MOEA/D frameworks on DTLZ1 with 10 objective functions.

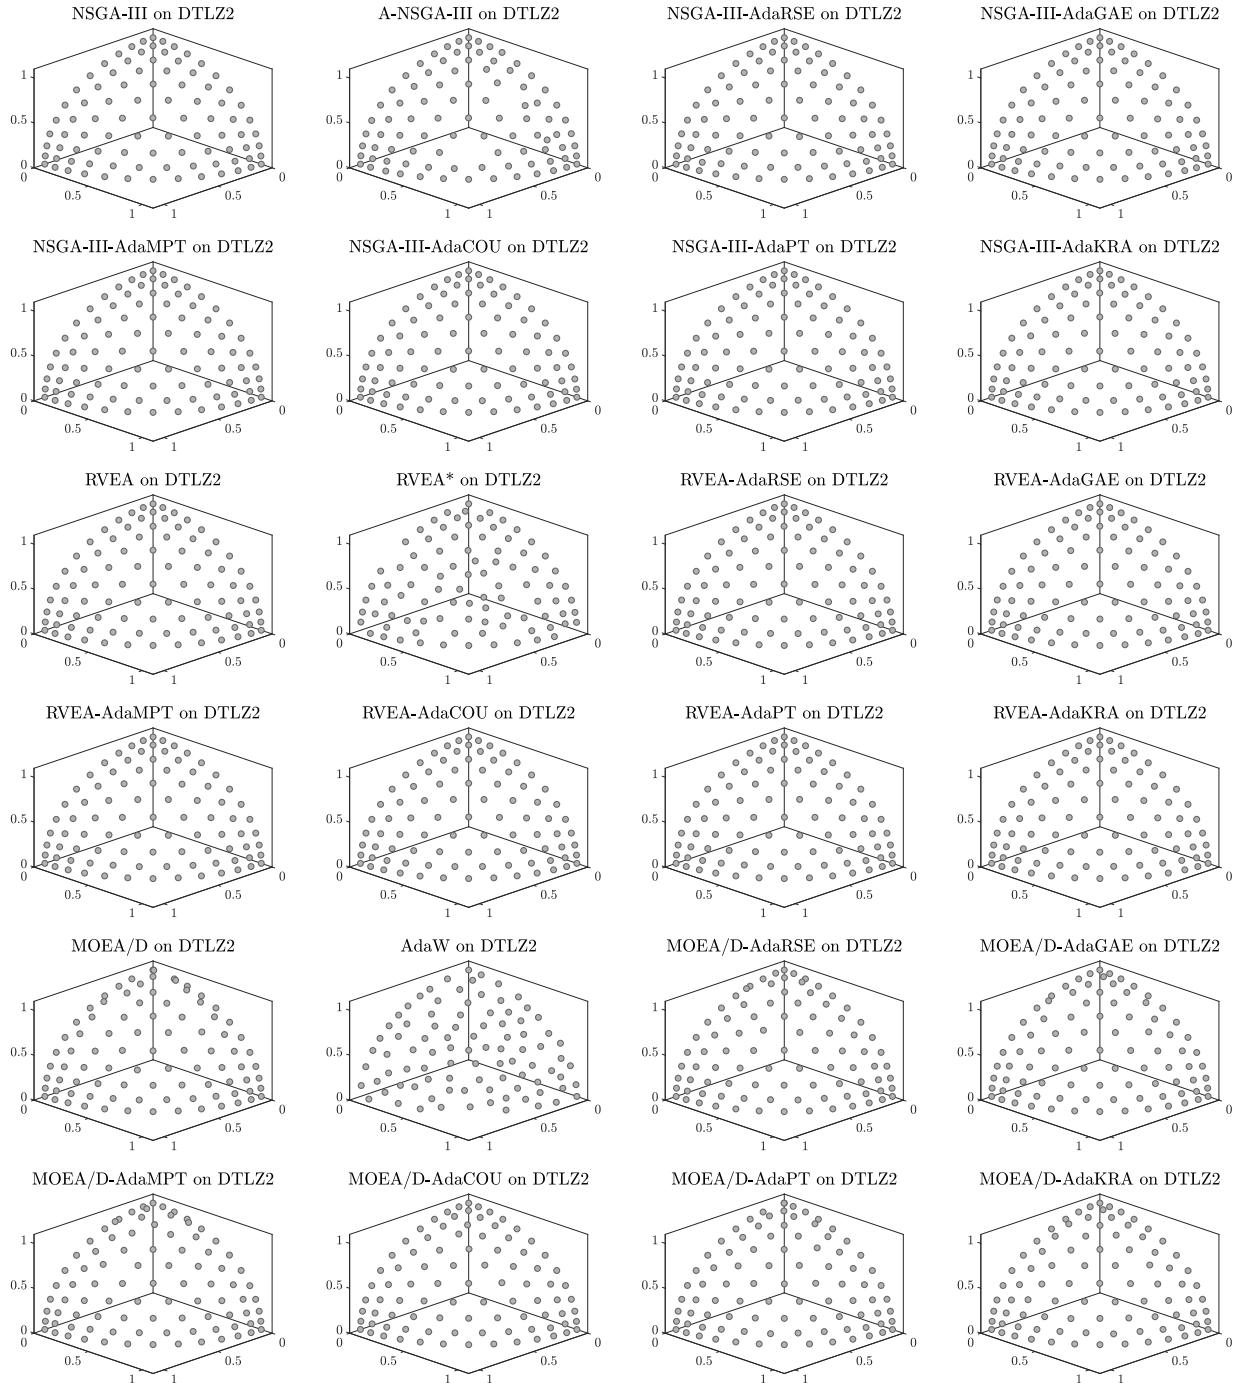

Figure 5: Final populations with the median HV value among 30 independent runs of MOEAs using the NSGA-III, RVEA, and MOEA/D frameworks on DTLZ2 with 3 objective functions.

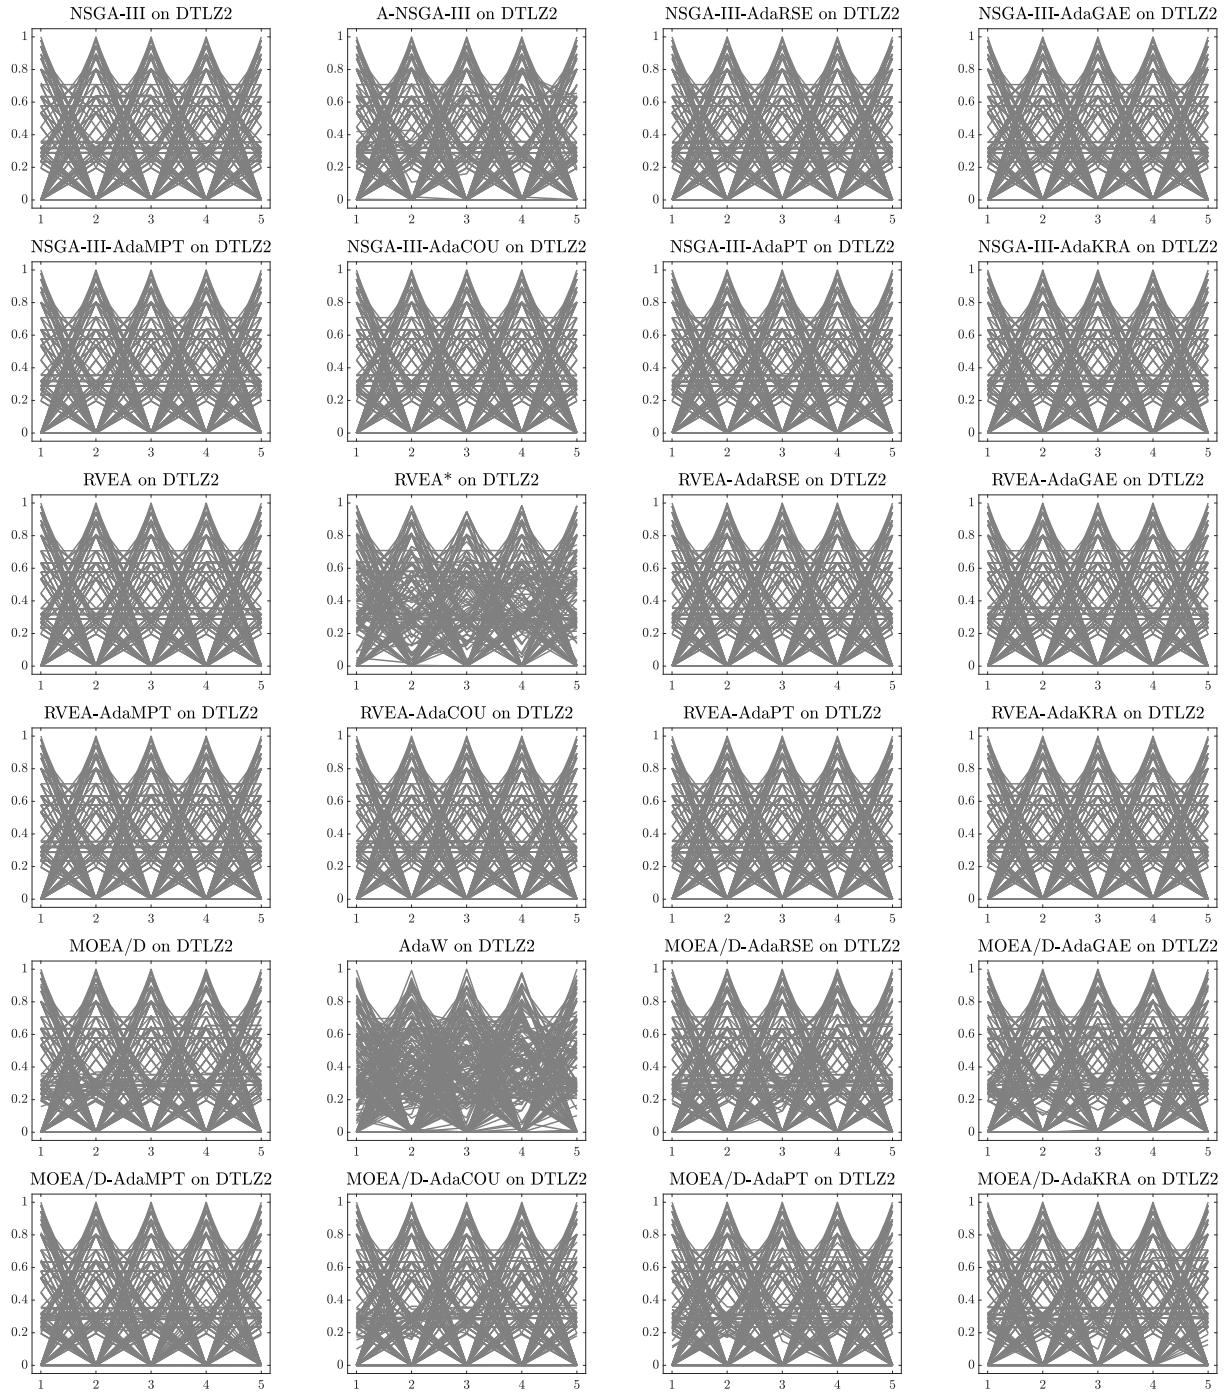

Figure 6: Final populations with the median HV value among 30 independent runs of MOEAs using the NSGA-III, RVEA, and MOEA/D frameworks on DTLZ2 with 5 objective functions.

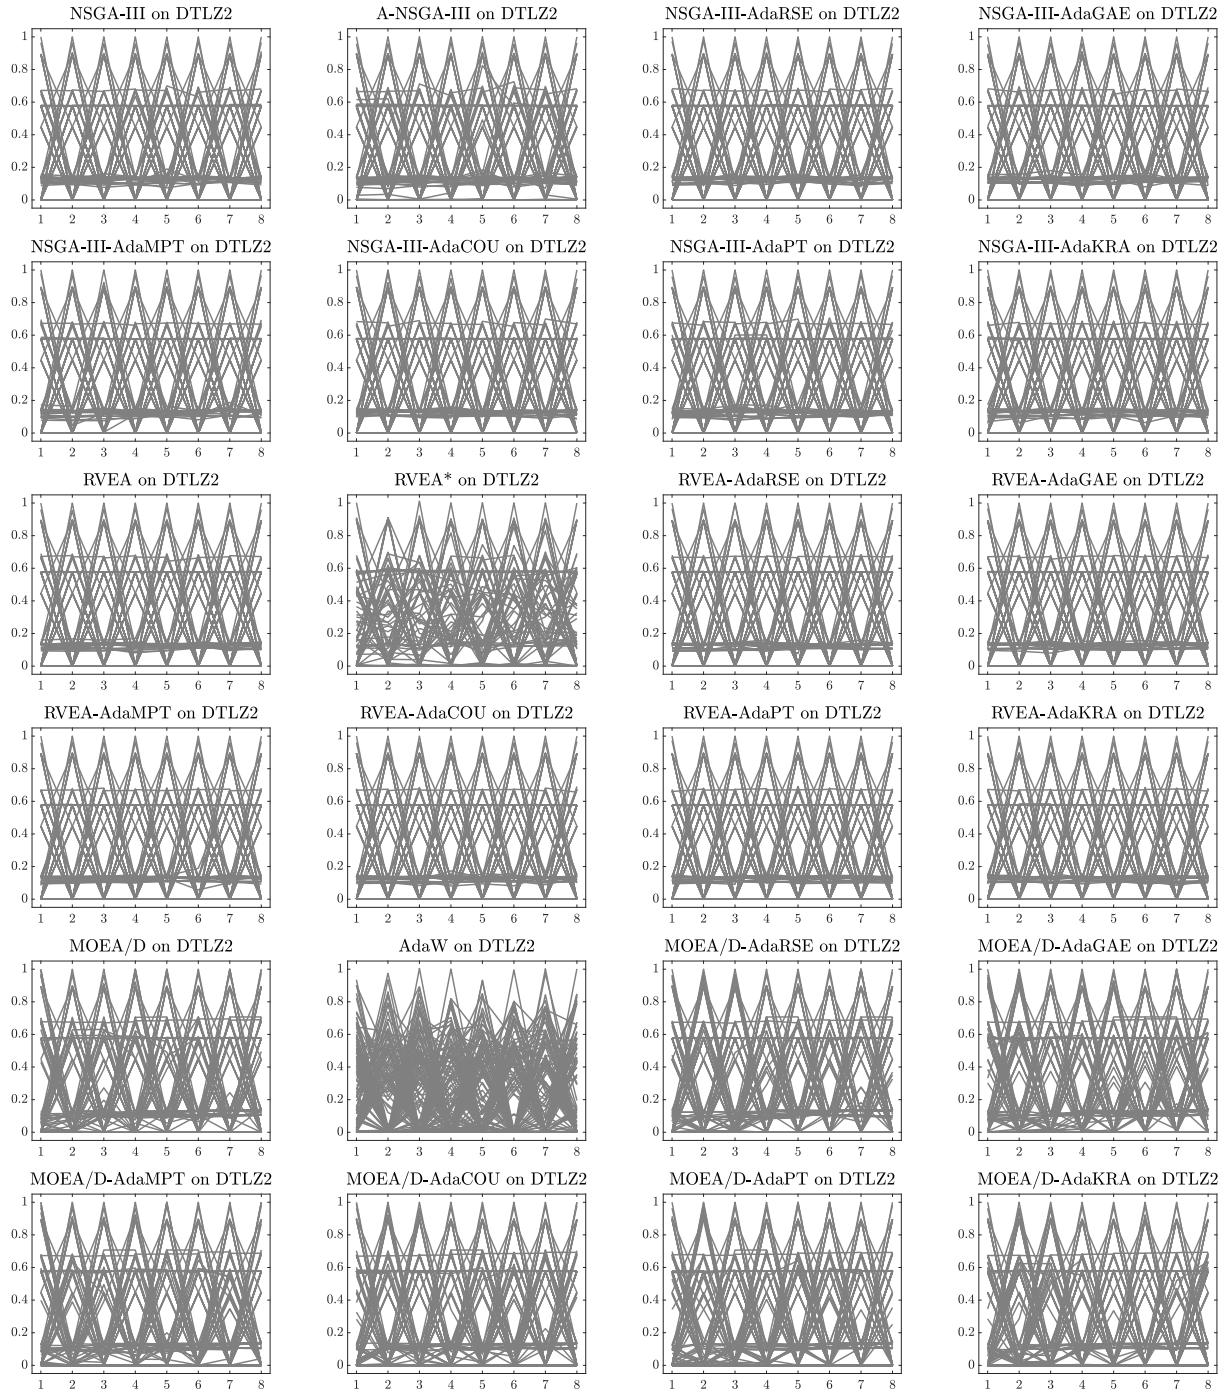

Figure 7: Final populations with the median HV value among 30 independent runs of MOEAs using the NSGA-III, RVEA, and MOEA/D frameworks on DTLZ2 with 8 objective functions.
